## STUBBLE FIELD CULTIVATOR

**Free flow of even poorly cut straw** – ensured by the large clearance between the working elements. The tine spacing is 41 cm and the spacing between the tines in a single row is 82 cm.

**Two-stage adjustment of KX tines** – one step reduces the rake angle of the tine and allows shallow work with full undercut. The second proves useful when there is a problem with the machine digging in. The chisel is set at an aggressive angle.

**Full undercut even in shallow work** – thanks to the special arrangement. The width of the undercutter is 440 mm, which is 3 cm wider than the tine pitch, allowing the operation of partially worn coulters.

**Digging in even in very dry conditions** – made possible by the individual pressure on the tine coulters (320 kg) and one of two adjustment stages.

**Works with older tractors with low lifting capacity of the three-point hitch** – KOS H 6 is equipped with a chassis. The axle has air brakes as standard.

**Optional extras** – the optional harrow B with two rows of AGGRESSIVE ø 460 mm discs completes the work of the tines by mixing straw with the topsoil.
